## **RNA velocity recap**

Assign directionality to transcriptomic states

Relative quantities of spliced and unspliced

Rate at which genes are being expressed

# RNA velocity: spliced and unspliced RNA levels indicate changing gene expression

# RNA velocity: spliced and unspliced RNA levels indicate changing gene expression

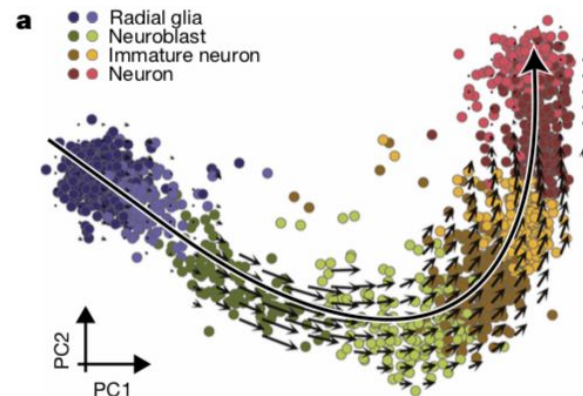

$v_{X,i}$  = **velocity** for gene X in cell i

# RNA velocity: spliced and unspliced RNA levels indicate changing gene expression

$v_{X,i}$  = **velocity** for gene X in cell i

# RNA velocity: spliced and unspliced RNA levels indicate changing gene expression

$v_{X,i}$  = velocity for gene X in cell i

# Visualizing RNA velocity trends

Goals:

- Encode direction, predicted states
- Differentiation, general cell state transitions, origin of rare cell types

# Visualizing RNA velocity trends - PCA

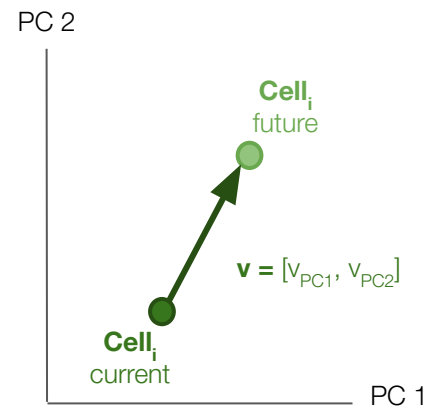

$$PC1 = 3X - 7Y$$
$$PC2 = 0.5X + 5Y$$

# Visualizing RNA velocity trends - PCA

$$\text{PC1} = 3X - 7Y$$

$$\text{PC2} = 0.5X + 5Y$$

$$v_{\text{PC1}} = 3v_X - 7v_Y$$

$$v_{\text{PC2}} = 0.5v_X + 5v_Y$$

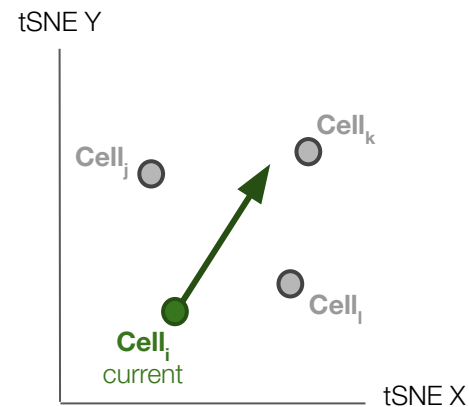

# Visualizing RNA velocity trends - non-linear embeddings

# Visualizing RNA velocity trends - non-linear embeddings

# Visualizing RNA velocity trends - non-linear embeddings

# Visualizing RNA velocity trends - non-linear embeddings

Transition probability:

$$P_{ix} \sim \text{corr}(v_{ix}, d_{ix})$$

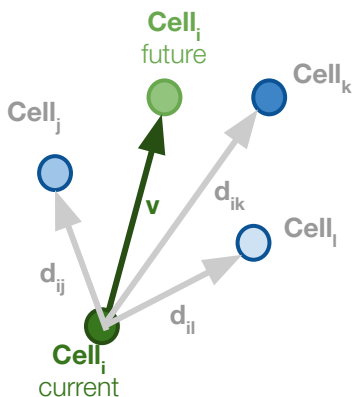

# Visualizing RNA velocity trends - non-linear embeddings

Transition probability:

$$P_{ix} \sim \text{corr}(v_{ix}, d_{ix})$$

Given an embedding  $\mathbf{X}$  of  $n$  cells:

$$\mathbf{X} = [x_1, x_2, \dots, x_{n-1}, x_n]$$

Velocity displacement of a cell in embedding:

$$v_{\text{tSNE}} \sim \sum_j P_{ij} \frac{(x_j - x_i)}{\|x_j - x_i\|}$$

# Visualizing RNA velocity trends - non-linear embeddings

Transition probability:

$$P_{ix} \sim \text{corr}(v_{ix}, d_{ix})$$

Given an embedding  $\mathbf{X}$  of  $n$  cells:

$$\mathbf{X} = [x_1, x_2, \dots, x_{n-1}, x_n]$$

Velocity displacement of a cell in embedding:

$$v_{\text{tSNE}} \sim \sum_j P_{ij} \frac{(x_j - x_i)}{\|x_j - x_i\|}$$

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

$X_c$  = observed current transcriptional state

$X_p$  = predicted future transcriptional state

$v_x$  = RNA velocity for cell X

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

2. compute composite distance (D) for all cell pairs

$$D_{A \rightarrow X} = -\cos(\theta_{AX}) * \frac{1}{\omega * d_{AX} + 1}$$

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

2. compute composite distance (D) for all cell pairs

$$D_{A \rightarrow X} = -\cos(\theta_{AX}) * \frac{1}{\omega * d_{AX} + 1}$$

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

2. compute composite distance (D) for all cell pairs

3. choose k neighbors with minimum D

Composite Distance  $A \rightarrow X$

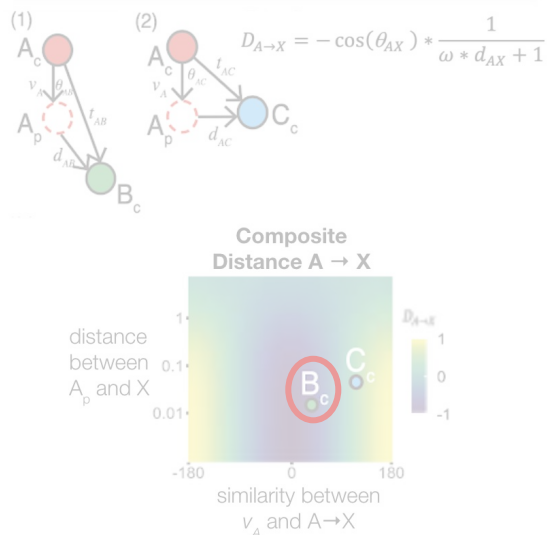

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

2. compute composite distance (D) for all cell pairs

3. choose k neighbors with minimum D

4. prune edges based on distance and/or similarity

# Visualizing RNA velocity trends: RNA-velocity informed 2D-embeddings using VeloViz

1. obtain current and projected future transcriptional states

2. compute composite distance (D) for all cell pairs

3. choose k neighbors with minimum D

4. prune edges based on distance and/or similarity

5. use force-directed layout to visualize in 2D

# VeloViz embeddings: simulated cycling and branching trajectories

2D embeddings of simulated single cell gene expression

**TC:** Trajectory Consistency

TC = 1: perfect representation of ground truth trajectory  
error over random seeds
